| 1       | 03 - Sound and Light | 00:00 - 02:26  
Reflected light allows us to see.  
Without light we cannot see. |
| 2       |                  | 02:26 - 04:27  
Both color and material affect the amount of light reflected. |
| 3       |                  | 04:27 - 05:40  
Light travels in a straight line |
| 4       |                  | 05:40 - 08:48  
The structure of the eye and how that allows us to see. (Iris, retina) |
| 5       | 07 - Universe at Your Fingertips | 08:48 - 11:22  
Light from the sun causes day and night due to the Earth’s rotation. |
| 6       |                  | 11:22 -  
The Earth’s tilt causes the seasons. This tilt also affects the amount of daylight.  
The moon orbits the Earth and is covered by meteor craters.  
We see the moon because we see the light from the sun reflecting off the moon. |
| 7       |                  | 14:27  
We can only see the portions of the moon that are reflecting light. WE call these phases. |
| 8       |                  | 15:59 - 17:14  
The structure of the sun. |
